Solar energy can be harnessed two primary ways: photovoltaics (PVs) are semiconductors that generate electricity directly from sunlight, while solar thermal technologies use sunlight to heat water for ...

Though thin-film PV represented around 3% of global PV deployed from 2015 through 2023, it accounted for more than 17% of U.S. PV deployments during this period (24% of utility-scale ...

In the last decade, solar has grown with an average annual rate of 26 percent, reaching a capacity of over 138 gigawatts in 2023. In that same year, solar energy accounted for 55 percent of ...

For solar PV, wind and bioenergy for power, deployment has been revised downwards. Solar PV accounts for over 70% of the absolute reduction, mainly from utility-scale projects, while offshore ...

Solar and wind energy will lead the growth in U.S. power generation for at least the next two years, according to EIA estimates. This report uses data from the EIA to analyze solar and wind...

Deployments will average 40 GW annually over the next five years, but the risk posed by attacks on the permitting of solar projects, further treasury guidance, and uncertainty in the solar supply chain could ...

In 2022, PV represented approximately 46% of new U.S. electric generation capacity, compared to 4% in 2010. Solar still represented only 9.0% of net summer capacity and 4.7% of annual generation in ...

Percentage change in solar energy generation relative to the previous year. Figures are based on gross generation and do not account for cross-border electricity supply. Energy Institute - ...
