Wind turbines use blades to collect the wind's kinetic energy. Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn.

Wind power is generated through the use of wind turbines, whose blades turn when the wind blows, which then spins a generator either directly or through a series of gears, ultimately creating electricity.

Wind energy, or wind power, is created using a wind turbine, a device that channels the power of the wind to generate electricity. The wind blows the blades of the turbine, which are ...

Wind power is a form of energy conversion in which turbines convert the kinetic energy of wind into mechanical or electrical energy that can be used for power. Wind power is considered a ...

Wind power is the use of wind energy to generate useful work. Historically, wind power was used by sails, windmills and windpumps, but today it is mostly used to generate electricity. This article deals ...

Overview
Wind energy resources
Wind farms
Wind power capacity and production
Economics
Small-scale wind power
Impact on environment and landscape
Politics
Wind power is the use of wind energy to generate useful work. Historically, wind power was used by sails, windmills and windpumps, but today it is mostly used to generate electricity. This article deals only with wind power for electricity generation. Today, wind power is generated almost completely using wind turbines, generally grouped into wind farms and connected to the electrical grid.

Wind energy is "variable": how much electricity it produces depends on how much wind is blowing. In any energy system that relies partly on wind, other energy sources have to be ramped up ...

Wind energy harnesses the natural movement of air to generate electricity through sophisticated turbine technology.
