What are the regulations for building a new tower?

Building a new tower or collocating an antenna on an existing structure requires compliance with the Commission's rules for environmental review. These regulatory processes ensure that appropriate measures are taken to protect environmental and historic resources.

What is the effect of pole deduction on the maximum wind load?

Impact of the pole deduction on the maximum wind loadThe pole deduction occurs in lateral position and depending on the shape of the radome, the maximum wind load is impacted. Below we can see the force distribution on antenna+pole and resultant force on antenna alone. Squared shape Rounded shapeThe pole deduction does not

What is the wind speed of a symmetrical antenna?

The wind speed is set at 150km/h with data acquisition every 1 °. For a symmetrical antenna the scanning is performed from 0 to 18 °. For asymmetrical antenna, the scanning is performed from 0 to 360°. Data acquisitions are carried out for one minute, at 20 Hz, filtered at 10 Hz. The

What NHPA requirements do I need to build a new tower?

A new tower construction requires: NHPA (including Section 106). Antenna Structure Registration (ASR) with the FCC. Certain collocations, such as those involving a height or footprint increase, may also require compliance with these same processes.

The Code of Federal Regulations (CFR) is the official legal print publication containing the codification of the general and permanent rules published in the Federal Register by the departments and agencies ...

(1) Radiation levels from telecommunications /broadcasting base stations shall be monitored to ensure that the base stations do not transmit electromagnetic waves with potential adverse effects on people ...

Building new towers or collocating antennas on existing structures requires compliance with the Commission's rules for environmental review.

Wind energy systems often operate without interrupting telecommunications services, however in some cases the placement of a turbine could lead to the disruption of communications signals.

The telecommunication services included in this review are those that have demonstrated to be more sensitive

to nearby wind turbines: weather, air traffic control and marine radars, radio navigation ...

This study investigates how wind energy siting policies, including local zoning ordinances and state-level public engagement rules, influence wind project siting decisions.

These design drivers depart from features found in conventional distributed wind turbines, thus necessitating unique design guidance. The supporting information for this guidance comes from ...

No entity may construct, operate or continue to operate a Wireless Telecommunications System within the City without having been issued a Wireless Telecommunications Permit by the Zoning ...
