Despite the historic usage of wind power to drain water and grind grain, the Netherlands today lags 21 of the 26 other member states of the European Union in the consumption of energy from renewable ...

The Netherlands is positioning itself at the forefront of the European energy transition. The goal is to achieve nearly 100% renewable electricity production by 2030, continuing to expand wind and solar ...

The Netherlands is on a fast track to expand its renewable energy capacity, projected to nearly triple by 2035, driven mainly by solar PV and offshore wind developments supported by government policies ...

The country's total renewable power capacity is forecast to reach 111.7GW by 2035, up from 41.6GW in 2024, registering a compound annual growth rate (CAGR) of 9.4% during 2024-2035.

Production from renewable sources increased by 21 percent in 2023 compared with the previous year. The share of electricity generated from fossil fuels fell, and the Netherlands exported ...

Over the last decade, renewable energy consumption has increased considerably in the Netherlands. From 2010 to 2022, the gross inland consumption of renewables more than doubled, ...

The Netherlands' National Energy System Plan aims for electricity supply to grow four-fold by 2050. This means greater deployment of renewables will be required, building on the country's ...

According to the most recent figures for 2024 (published in June 2025), the Netherlands had a 19.8% share of renewables (ie, wind energy, solar energy, geothermal heat, biomass, ...
