-----

Radial lines Several are drawn so orientations that the area may between each successive pair orientation is centered which on the maximizes direction wind of the reported wind.

Simple equations for conversion of vector wind components, speed and direction. In this document it is assumed that all trig functions use or return angles in radians. However, angles are converted to ...

The expressions below can be used to convert horizontal wind vector information directly between the orthogonal component and speed/direction conventions without the need for first converting ...

The characteristics of wind speed, wind direction, and wind profile are crucial factors influencing the efficiency of wind resource and the accuracy of parachute landing operations.

wind\_direction (pint.Quantity) - Wind direction, specified as the direction from which the wind is blowing (0-2 pi radians or 0-360 degrees), with 360 degrees being North.

This calculator provides wind component estimates for informational purposes only. Always rely on official aviation weather briefings and ATC information for critical flight decisions.

The meteorological wind direction is the direction from which the wind is blowing. Wind direction increases clockwise such that a northerly wind is 0°; an easterly wind is 90°; a southerly ...
