---

As the world faces a crisis of declining bird populations, a new study has revealed a surprising source of bird mortality: the increasing use of wind and solar energy facilities.

Solar energy production in the United States causes an estimated 37,800 to 138,600 bird deaths annually, a figure significantly lower than the 14.5 million deaths attributed to fossil fuel power ...

As a result of the investigation, the Fish and Wildlife Service estimated that the number of birds killed by the Ivanpah Solar Power Plant is "6,000 birds per year."

To provide a more comprehensive overview of bird mortality patterns, we synthesized results from fatality monitoring studies at 10 photovoltaic solar facilities across 13 site-years in ...

Little work has been done specifically on bird mortality at solar farms, although it is known that millions of bats and large birds of every kind are killed every year by giant wind turbines and their ...

Bird mortality encompasses the death of birds resulting from collisions with solar infrastructure, exposure to heat from concentrated solar power plants, and habitat disruption caused ...

Findings indicate that the leading causes of bird deaths at CSP plants are from collisions (primarily with reflective surfaces; i.e., heliostats) and singeing caused by concentrated solar flux. Safe irradiance ...

Vander Zanden and colleagues performed geospatial analyses of stable hydrogen isotope data obtained from feathers of 871 individual birds found dead at solar and wind energy facilities in ...
