Is energy sharing a promising business model in microgrids?

Case studies validate the benefits of energy sharing in peer-to-peer trading in microgrids. Energy sharing has gained substantial popularity in improving the controllability of distributed energy resources (DERs). In this chapter, we introduce the concept of sharing economy as a novel and promising business model in microgrids.

How do microgrids manage energy?

**Energy Management:** Microgrids need a system to manage the flow of energy, ensuring that energy is being used efficiently and effectively. This includes monitoring and controlling the mix of energy sources, as well as balancing the energy supply and demand.

Why is energy storage important in a microgrid?

**Energy Storage:** Energy storage systems, such as batteries, are an important component of microgrids, allowing energy to be stored for times when it is not being generated. This helps to ensure a stable and reliable source of energy, even when renewable energy sources are not available.

Why do we need a microgrid?

**Increased Energy Security:** Microgrids can reduce dependence on fossil fuels and the traditional power grid, providing a more secure and stable energy supply. This is particularly important in areas with unstable or unreliable power grids, where power outages are common.

A microgrid is a local energy grid that can operate independently or in conjunction with the traditional power grid. It is comprised of multiple distributed energy resources (DERs), such as solar panels, ...
