Market and Technology Assessment of Grid-Scale Energy Storage required to Deliver Net Zero and the Implications for Battery Research in the UK Final

The impacts that these technologies have on the system were assessed using scenario analysis to find the "optimal" level of LDES deployment across a range of power market scenarios.

The Distribution Future Energy Scenarios comprises an interactive summary, a technical report, and interactive maps that create a picture of how the energy system might look by 2050.

Scenarios for key drivers of demand and generation were developed within UK Power Networks' three licence areas and brought together to create four overarching scenarios that represent different ...

The Distribution Future Energy Scenarios (DFES) map is a visual representation of the scenario projections which National Grid Electricity Distribution use for long term strategic network planning.

This map displays the scenario projections at an Electricity Supply Area (ESA) or Local Authority level. You can view bespoke reports for each Local Authority by clicking on the map.

This interactive heat map displays our Distribution Future Energy Scenarios (DFES) forecasts for key drivers within our licence area up until 2050. The scenarios are designed to illustrate energy futures ...

These scenarios explore a range of credible pathways for the development of energy supply and demand and how the UK's 2050 net zero carbon emissions target can be met. Energy storage has ...
