Earthquake Brace and Bolt (EBB) retrofit technique is a cost-effective and efficient way to improve the structural integrity of an existing building and make it more resistant to seismic activity.

In 2010, one year before the Great East Japan Earthquake, Kubota succeeded in its long-awaited development of GENEX, a new earthquake-resistant ductile iron pipe.

In 2019, the Ridgecrest earthquakes taught us 53% of damaged commercial solar arrays failed due to inadequate support structure design. That's where seismic design of photovoltaic support structures ...

With global seismic activity increasing by 18% since 2020 according to the 2024 Global Seismic Report, earthquake-resistant brackets have become critical for solar projects in vulnerable ...

Proper bracket installation is key to ensuring the longevity and performance of a solar panel system. Solar panel brackets are an important part of the installation process and should be installed by a ...

Designated seismic systems are those active mechanical and electrical components that must remain operable following an earthquake and those components containing hazardous components.

Seismic Support and Hanger systems are no longer optional--they are non-negotiable safeguards for modern infrastructure. By combining rigorous engineering, compliant materials, and ...

A traditional earthquake-resistant design philosophy is mainly focused on the 'life-safety' performance level, which implies that the structure undergoes significant damage ...
