The utility model relates to a dual-purpose electric generator driven by wind power or animal power, which is made by improving an original animal power electric generator and comprises not...

The turbines can begin producing electricity with wind speeds as low as 9 mph (14 km/h) and reach full production at 31 mph (50 km/h). They shut down at sustained wind speeds of 56 mph (90 km/h).

The belief that wind turbines emit harmful sound rays affecting nearby livestock, like cows and horses, is a widely debunked myth due to lack of scientific evidence linking wind energy systems ...

Wind farms can have a very severe and wide-reaching effect on the continued rights of equestrians to use off-road routes, pushing them onto busy roads or causing them to transport horses to less hostile ...

Anecdotal reports from livestock farmers worldwide have raised concerns about wind turbines. No matter the species, reports blame wind turbines when no other cause is found.

Regarding the impact of wind turbines on horses" behaviour, a German study (Seddig, 2004) analysed the behaviour of horses stationed near wind turbines. This study explains that as ...

Power plant details for Wild Horse, a wind farm located in Ellensburg, WA. View the monthly generation and consumption, generator details, and more for Wild Horse.

Unless your goal is to produce the least amount of electricity possible when it"s most needed, while negatively impacting the most land, wildlife, and people possible, then the numbers ...
